Accessibility Report

We run accessibility tests for each page of our websites on both mobile and desktop.

There are two main issues included in our accessibility report:

1. [aria-*] attributes do not match their roles:

    This issue came from the Marker component on the map. Since we use the react-map-gl library, [aria-label="Map marker"] is added to the Marker component. We cannot modify the aria-label setting of this component.

2. [aria-hidden="true"] elements contain focusable descendents

    This issue came from the Carousel component. To show a list of trails in Carousel, we use the react-slick library. [aria-hidden="true"] is added to the Carousel item which is not shown in the current window.

Except for these two components, all the contents on our websites are meeting the accessibility requirement.
